DIGITAL SOLUTION BUILDERS

ProposalFlow

Create. Send. Close. — AI-generated proposals with e-signature and integrated payments.

VERSION
1.0

ISSUED
2026-06-08

OWNER
Daniel Solomon Bangura

STATUS
Deployed on Vercel — pre-launch

1. Document Control

Field	Value
Product	ProposalFlow — AI proposal generation with e-sign and payments
Version	1.0
Status	Deployed on Vercel — pre-launch (no custom domain yet)
Owner	Daniel Solomon Bangura
Brand	Digital Solution Builders (DSB)
Classification	Confidential — Digital Solution Builders
Governance	T2 (Limited-risk). Profile: `AI Governance/profiles/proposalplatform.md`

> *ProposalFlow is a DSB product. This document records what is built today and the gaps that must close before public launch.*

---

2. Executive Summary

What it is. A SaaS that takes a consultant or agency from blank page to paid contract in one place: it **generates** a structured proposal with AI, lets the client **sign** it on a public page, and **collects payment** — with email and status tracking throughout. Tagline: *Create. Send. Close.*

Why it exists. For small consultancies and digital teams in Africa and other emerging markets, the proposal-to-payment journey is fragmented across a word processor, an e-signature tool, an invoicing tool and email. ProposalFlow collapses that into a single flow, with the first draft written by Claude.

Current status. Deployed on Vercel with the full flow working end-to-end — AI generation, account management, e-signature, Flutterwave payments, Resend email and Amplitude analytics. It is pre-launch: there is no custom domain yet, and two governance items (Supabase Row-Level Security hardening; a published privacy notice with sub-processor disclosure) must close before onboarding real customers.

The single ask. Authorise the pre-launch hardening sprint — confirm RLS isolation across all tenant tables and publish the privacy notice — then attach a custom domain and open a private beta.

---

3. Problem & Context

The problem. A consultant who wins work still loses days to mechanics: drafting a credible proposal, getting it signed, and getting paid. Each step lives in a different tool, none of them talk to each other, and the client experience is disjointed.

Why now. Two shifts make a single integrated flow viable in emerging markets: LLMs can draft a genuinely usable 15-section proposal in seconds, and pan-African payment rails (Flutterwave — card, bank transfer, mobile money) make collecting payment inside the same product practical.

The approach. One product that owns the whole arc — generate, send, sign, pay — multi-tenant from day one, with payment data kept entirely out of the AI path.

---

4. Users & Personas

Independent consultant / small agency owner (primary). Wins a client, needs a professional proposal fast, and wants to be paid without chasing. Often serving NGOs, ministries of health, or donor-funded programmes (WHO,

USAID/Gates grantees, EHR/LMIS implementers).

The client (recipient). Receives a link, reviews the proposal, signs on a public page, and pays — no account required.

Team member. Invited into a workspace to collaborate on proposals and templates.

---

5. Scope

In scope (v1.0, shipped)	Out of scope (v1.0)	Later
AI proposal generation (15 sections)	Multi-currency tax/VAT handling	Custom domain + public launch
Accounts, dashboard, team, templates	CRM / pipeline management	Proposal analytics (open/sign funnels)
E-signature on public client pages	Offline mode	Additional payment providers
Payments (Flutterwave)	White-label theming	Published privacy + sub-processor notice (pre-launch gate)
Transactional email (Resend)	—	RLS hardening verification (pre-launch gate)

---

6. Functional Requirements & Feature Set

6.1 AI proposal generation — Shipped

- Claude (Haiku) generates a structured proposal from client inputs (client name, project type, scope, amount, timeline, tone).
- Produces 15 sections: executive summary, problem statement, core challenges, solution, implementation, phased delivery, milestones, team, budget breakdown, payment schedule, terms, next steps and more.

6.2 Authentication & accounts — Shipped

- Supabase Auth (email/password) sign-in / sign-up; multi-tenant user isolation.
- Dashboard with proposal history; settings; team management and colleague invites.

6.3 Proposal management — Shipped

- Draft, edit, delete and duplicate proposals; rich-text editing via TipTap.
- Status tracking: draft → sent → viewed → signed → paid.
- Reusable proposal templates.

6.4 E-signature & client pages — Shipped

- Public, token-addressed proposal pages (`/p/{public_token}`) where clients view, sign (signature canvas) and pay.

6.5 Payments & email — Shipped

- Flutterwave integration (card, bank transfer, mobile money) with currency/amount validation; payment status pending → completed. Payment data is never sent to the AI.
- Resend for transactional email.

6.6 Analytics — Shipped

- Amplitude product telemetry.

---

7. Non-Functional Requirements

- **Tenant isolation (P0, pre-launch gate).** Supabase Row-Level Security must be verified across every tenant-scoped table before real customer data lands.

- **AI trust boundary.** Payment and financial data are excluded from prompts sent to Claude; the model only ever sees proposal content inputs.
- **Privacy & compliance (P1 — the top priority after the P0 RLS gap).** A privacy notice — including disclosure of Anthropic as an AI sub-processor — must be published before launch.
- **Performance.** Next.js 16 App Router on Vercel; AI generation returns within a few seconds for a standard proposal.
- **Reliability.** Email and payment callbacks are idempotent against status transitions.

---

8. Technical Architecture

- **Frontend / framework.** Next.js 16 (App Router) + React 19 + TypeScript + Tailwind CSS 4. Note: Next.js 16 has breaking changes from older training data — consult the in-repo docs before changing framework code.
- **Backend.** Supabase (Postgres + Auth), with RLS as the isolation boundary.
- **AI.** Anthropic Claude API (`claude-haiku-4-5`) for generation.
- **Payments.** Flutterwave. **Email.** Resend. **Analytics.** Amplitude.
- **Hosting.** Vercel. **Brand.** Indigo primary; Geist/Inter typography; FileText wordmark.

---

9. Success Metrics & KPIs

Metric	Target
Proposal generation latency	< 5 s for a standard 15-section proposal
Generation cost per proposal	Low single-digit cents (Haiku)
Funnel completion (sent → signed → paid)	Establish baseline in private beta
Tenant data isolation	100% of tables RLS-verified (pre-launch gate)
Payment success rate	≥ 99% of initiated payments resolve cleanly

---

10. Risks, Roadmap & Appendix

10.1 Risks & mitigations

Risk	Mitigation
Cross-tenant data exposure	Verify RLS on all tables before launch (P0 gate)
Undisclosed AI sub-processor	Publish privacy notice naming Anthropic before launch (P1 gate)
Sensitive data in prompts	Payment/financial data excluded from the AI path by design
Generated content quality variance	Structured 15-section template + human edit (TipTap) before send

10.2 Roadmap & milestones

- **Now (shipped):** generation, accounts/team/templates, e-sign, payments, email, analytics — deployed on Vercel.
- **Pre-launch gate:** RLS verification + published privacy/sub-processor notice.
- **Next:** custom domain, private beta, proposal analytics.
- **Later:** additional payment providers, white-label theming.

10.3 Appendix

- **Glossary.** RLS = Supabase Row-Level Security; public token = the unguessable identifier on a client proposal page; sub-processor = a third party (here, Anthropic) processing data on the controller's behalf.
- **Source docs.** Project `CLAUDE.md`; governance profile `AI Governance/profiles/proposalplatform.md`.
